Project Abstract

Project Title: Neighborhood Skill & Tool Sharing Exchange

Domain: Community Networking, Peer-to-Peer (P2P) Marketplace, Sustainable Sharing Economy

Technology Stack: MERN Stack (MongoDB, Express.js, React.js, Node.js), Vite, TailwindCSS, Socket.io, Razorpay

Abstract

In modern urban and suburban neighborhoods, individuals frequently purchase expensive tools or possess specialized skills that remain underutilized. Conversely, others in the same community often need these exact resources for short-term tasks but lack affordable access to them. The Neighborhood Skill & Tool Sharing Exchange is a comprehensive, full-stack web application designed to bridge this gap by fostering a hyper-local, peer-to-peer sharing economy.

The primary objective of this platform is to build a secure, community-driven ecosystem where neighbors can seamlessly rent out physical tools (e.g., power drills, lawnmowers) and offer professional or casual skills (e.g., tutoring, plumbing, gardening). By centralizing these resources, the platform promotes sustainability, reduces unnecessary consumption, and strengthens community bonds.

Developed using the robust MERN stack and optimized with modern tooling like Vite and Tailwind CSS v4, the application delivers a highly responsive and intuitive user experience. The backend architecture features over 68 RESTful API endpoints ensuring scalable data management, modularity, and secure data flow.

Key functionalities of the platform include:

Comprehensive Booking & Availability System: Users can browse, request, approve, and manage the lifecycle of tool rentals and skill appointments with real-time availability checking and conflict prevention.

Secure Payments & Trust Mechanisms: Integrated with the Razorpay payment gateway, the platform securely processes rental fees, security deposits, and late penalties. To ensure a safe environment, the system incorporates a Trust Score metric, user verification, and a transparent review/rating system.

Real-Time Communication: Utilizing Socket.io, the platform offers instant, real-time messaging, allowing lenders and renters to coordinate logistics without sharing personal contact information.

Administrative Moderation: A dedicated admin dashboard provides system-wide oversight, enabling administrators to monitor user activities, resolve reported disputes, and enforce platform guidelines by suspending malicious accounts.

In conclusion, the Neighborhood Skill & Tool Sharing Exchange provides a scalable, secure, and modern technological solution to localized resource sharing. It successfully digitizes community cooperation, paving the way for more sustainable and economically efficient neighborhoods.

Folder structure

The screenshot shows the VS Code interface with the Explorer panel on the left displaying the project structure. The main editor shows the `index.html` file with the following content:

```
1 <!doctype html>
2 <html lang="en">
3   <head>
4     <meta charset="UTF-8" />
5     <link rel="icon" type="image/svg+xml" href="/favicon.svg" />
6     <meta name="viewport" content="width=device-width, initial-scale=1.0" />
7     <title>NeighborShare - Skill & Tool Exchange</title>
8   </head>
9   <body>
10    <div id="root"></div>
```

The terminal at the bottom shows the output of `npm run dev`, indicating that the application is running successfully.

The screenshot shows the VS Code interface with the Explorer panel on the left displaying the project structure. The main editor shows the `index.html` file with the following content:

```
1 <!doctype html>
2 <html lang="en">

Frontend Architecture (React.js & Vite)

All the files responsible for what the user sees and interacts with on their browser are primarily located in the `src/` and `public/` directories.

index.html (Located in the root directory)

Purpose: The foundational HTML page of your website.

Details: Since React is a Single Page Application (SPA), this is the only HTML file loaded by the browser. React dynamically injects all the website's content into a single `<div>` inside this file.

src/main.jsx

Purpose: The entry point for the React application.

Details: It hooks the React application into the index.html file and typically wraps the app in global providers (like Redux, Context APIs, or Router).

src/App.jsx

Purpose: The main root component of your User Interface.

Details: This file usually holds the Routing logic (using react-router-dom), dictating which Page component should be displayed when a user navigates to a specific URL (e.g., showing the Home component at / and the Dashboard component at /dashboard).

src/pages/ (Directory)

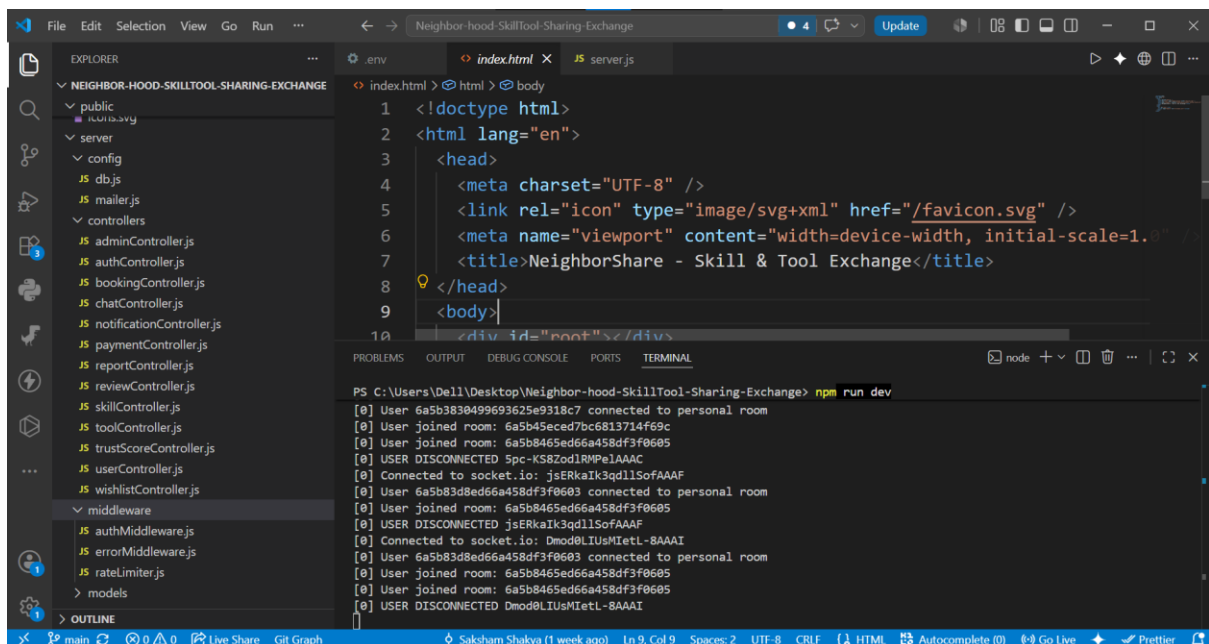

Purpose: Contains the main views/screens of your website.

Details: Files here represent full web pages (e.g., Home.jsx, Login.jsx, ToolDetails.jsx).

src/components/ (Directory)

Purpose: Contains smaller, reusable UI elements.

Details: Instead of writing the same code multiple times, elements like Navbar.jsx, Footer.jsx, or ToolCard.jsx are created here and imported into various pages to build the UI like Lego blocks.

The screenshot shows a VS Code editor with a project named 'Neighbor-hood-SkillTool-Sharing-Exchange'. The Explorer panel on the left shows the file structure, including a 'public' directory, a 'server' directory with 'db.js', 'mailer.js', and 'controllers' (containing various controller files like 'adminController.js', 'authController.js', etc.), and a 'middleware' directory. The main editor area shows the 'index.html' file with the following content:

```
1 <!doctype html>
2 <html lang="en">
3   <head>
4     <meta charset="UTF-8" />
5     <link rel="icon" type="image/svg+xml" href="/favicon.svg" />
6     <meta name="viewport" content="width=device-width, initial-scale=1.0" />
7     <title>NeighborShare - Skill & Tool Exchange</title>
8   </head>
9   <body>
10    <div id="root"></div>
```

The terminal window at the bottom shows the output of running 'npm run dev'. It displays a series of messages indicating user connections and disconnections to a socket.io server, such as 'User 6a5b3830499693625e9318c7 connected to personal room' and 'USER DISCONNECTED 5pc-KS8Zod1RMPe1AAAC'.

The screenshot shows the initial state of the project in VS Code. The Explorer sidebar on the left displays the file structure: a 'server' directory containing 'models', 'Booking.js', 'Category.js', 'Chat.js', 'Message.js', 'Notification.js', 'Payment.js', 'Report.js', 'Review.js', 'Skill.js', 'Tools.js', 'User.js', 'routes', and 'utils'. The main editor area shows the 'index.html' file with the following content:

```
1 <!doctype html>
2 <html lang="en">
3   <head>
4     <meta charset="UTF-8" />
5     <link rel="icon" type="image/svg+xml" href="/favicon.svg" />
6     <meta name="viewport" content="width=device-width, initial-scale=1.0" />
7     <title>NeighborShare - Skill & Tool Exchange</title>
8   </head>
9   <body>
10    <div id="root"></div>
```

The bottom panel shows the terminal with the command 'npm run dev' and its output, which includes messages about user connections and disconnections to a Socket.io server.

This screenshot shows the project structure after adding more files. The Explorer sidebar now includes a 'routes' directory with files like 'adminRoutes.js', 'authRoutes.js', 'bookingRoutes.js', 'chatRoutes.js', 'notificationRoutes.js', 'paymentRoutes.js', 'reportRoutes.js', 'reviewRoutes.js', 'skillRoutes.js', 'toolRoutes.js', 'trustScoreRoutes.js', 'userRoutes.js', and 'wishlistRoutes.js'. The main editor area still shows the 'index.html' file with the same content as the previous screenshot.

Backend Architecture (Node.js & Express)

All the files responsible for database interactions, business logic, and security are located in the server/ directory.

server/server.js

Purpose: This is the main entry point of your backend application.

Details: It starts the Express server on a specific port (like 5000), initiates the connection to your MongoDB database, and sets up WebSocket (Socket.io) for real-time chat features.

server/app.js

Purpose: This file configures the Express application itself.

Details: It imports all the API routes, sets up global middleware (like CORS to allow requests from the frontend, cookie-parsers, and body-parsers), and defines global error handlers.

server/models/ (Directory)

Purpose: Defines the structure of your database collections.

Details: It contains Mongoose schema files (e.g., User.js, Tool.js, Booking.js). These files dictate exactly what fields (like name, email, price, location) are allowed to be saved in the MongoDB database.

server/controllers/ (Directory)

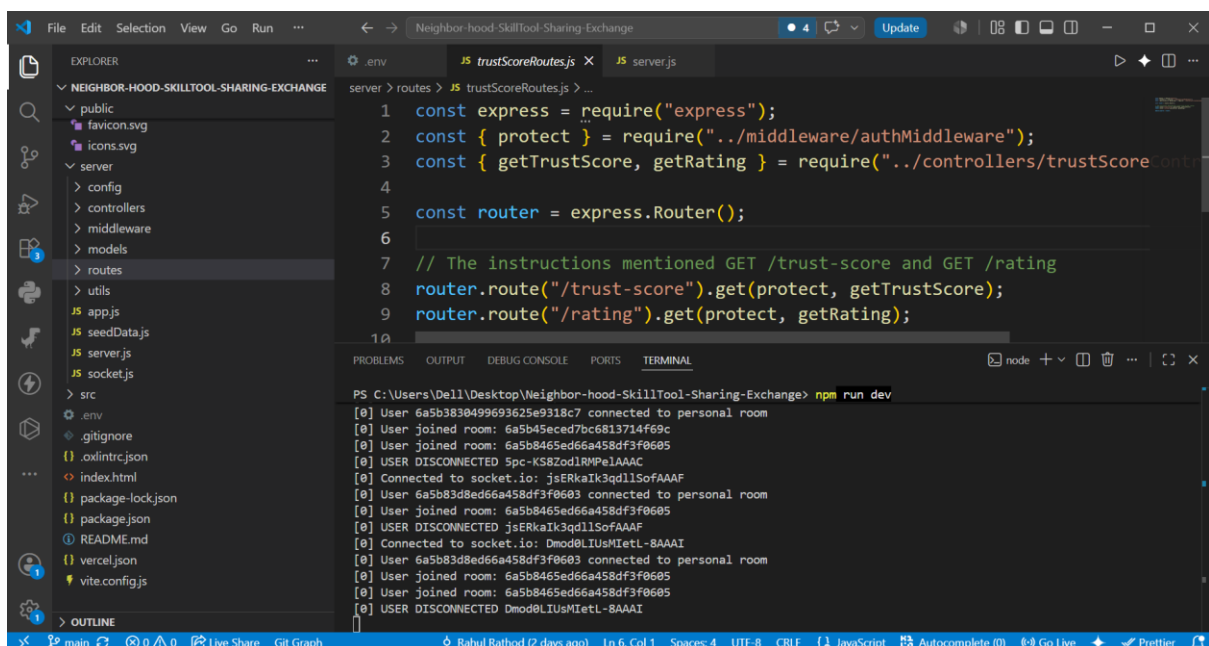

Purpose: Contains the core business logic of your application.

Details: When an API endpoint is hit, the controller executes the actual work. For example, toolController.js has the logic to save a new tool to the database, while authController.js contains the logic to hash a password and log a user in.

server/routes/ (Directory)

Purpose: Maps URLs (Endpoints) to their respective Controller functions.

Details: Files here (like toolRoutes.js or authRoutes.js) define whether a request is a GET, POST, PUT, or DELETE, and which controller function should handle it.

The screenshot shows a VS Code editor with the following components:

- EXPLORER:** Displays the project structure. The 'server' directory is expanded, showing subdirectories like 'config', 'controllers', 'middleware', 'models', 'routes', 'utils', and files like 'app.js', 'seedData.js', 'server.js', 'socket.js', and 'src'.
- EDITOR:** The active file is 'trustScoreRoutes.js' in the 'server/routes' directory. The code is as follows:

```
1 const express = require("express");
2 const { protect } = require("../middleware/authMiddleware");
3 const { getTrustScore, getRating } = require("../controllers/trustScoreController");
4
5 const router = express.Router();
6
7 // The instructions mentioned GET /trust-score and GET /rating
8 router.route("/trust-score").get(protect, getTrustScore);
9 router.route("/rating").get(protect, getRating);
```
- TERMINAL:** Shows the output of the 'npm run dev' command. It displays a series of log messages indicating user connections and disconnections to the application, such as 'User 6a5b3830499693625e9318c7 connected to personal room' and 'USER DISCONNECTED 5pc-KS8Zod1RMPe1AAAC'.

Root Configuration Files

These files sit in the main root folder and manage the overarching settings of the project.

package.json

Purpose: The manual of your project.

Details: It lists all the third-party libraries (dependencies) installed in your project (like React, Tailwind, Express, Mongoose). It also contains the "scripts" (like npm run dev) which use the concurrently package to start both the backend and frontend at the exact same time.

vite.config.js

Purpose: Configuration for your frontend build tool.

Details: Vite is the engine that compiles your React code so the browser can understand it. This file configures how Vite behaves, compiles plugins, and handles local development servers.

.env

Purpose: Environment Variables (Secrets).

Details: This file stores sensitive data that should never be uploaded to GitHub or made public. It includes your database connection string (MONGO_URI), payment gateway keys (RAZORPAY_KEY), and encryption secrets (JWT_SECRET).

API Documentation

Total APIs Integrated: 68

The backend architecture consists of 68 APIs, perfectly structured and grouped. All endpoints are fully hooked up with the React frontend and are optimized for Serverless deployment.

1. Auth APIs (9) - `/api/auth`

Method	Endpoint	Description
POST	<code>/register</code>	Register a new user
POST	<code>/login</code>	Login user and issue JWT
POST	<code>/admin-login</code>	Admin login
POST	<code>/logout</code>	Logout user and clear session
POST	<code>/refresh-token</code>	Refresh authentication token
POST	<code>/forgot-password</code>	Send forgot password email link
POST	<code>/reset-password</code>	Reset user password
POST	<code>/verify-email</code>	Verify user's email address
POST	<code>/verify-neighborhood</code>	Verify user's neighborhood status

2. User APIs (6) - `/api/users`

Method	Endpoint	Description
GET	<code>/profile</code>	Get logged-in user profile
PUT	<code>/profile</code>	Update user profile details
GET	<code>/address</code>	Get user address
PUT	<code>/address</code>	Update user address
GET	<code>/admin</code>	Get Admin User details
GET	<code>/listings</code>	Get user listed tools and skills

3. Tool APIs (7) - `/api`

Method	Endpoint	Description
POST	<code>/tool</code>	Add a new tool listing
GET	<code>/tool</code>	Get all available tools
GET	<code>/tool/:id</code>	Get details of a specific tool
PUT	<code>/tool/:id</code>	Update a tool listing
DELETE	<code>/tool/:id</code>	Delete a tool listing
GET	<code>/categories</code>	Get all tool categories
GET	<code>/search</code>	Search tools by keyword or category

4. Skill APIs (5) - `/api/skill`

Method	Endpoint	Description
POST	<code>/skill</code>	Add a new skill listing
GET	<code>/skill</code>	Get all available skills
GET	<code>/skill/:id</code>	Get details of a specific skill
PUT	<code>/skill/:id</code>	Update a skill listing
DELETE	<code>/skill/:id</code>	Delete a skill listing

5. Booking APIs (13) - `/api`

Method	Endpoint	Description
POST	<code>/booking</code>	Create a new booking request
GET	<code>/booking</code>	Get bookings for the current user
GET	<code>/booking/:id</code>	Get details of a specific booking
PUT	<code>/booking/:id</code>	Update booking status (e.g. approve)
DELETE	<code>/booking/:id</code>	Delete a booking request
POST	<code>/cancel-booking</code>	Cancel an active booking
GET	<code>/availability</code>	Get unavailable dates for a specific tool
POST	<code>/deposit</code>	Process a security deposit payment
GET	<code>/rental-history</code>	Get history of tools rented and lent out
POST	<code>/booking/:id/remind</code>	Send a reminder email for an active booking
POST	<code>/booking/:id/not-returned</code>	Mark a booking as not returned
POST	<code>/booking/:id/report</code>	Report a renter for an issue
POST	<code>/booking/:id/pay-late-fee</code>	Pay late fees for a booking

6. Admin APIs (6) - `/api/admin`

Method	Endpoint	Description
GET	<code>/dashboard</code>	Get admin dashboard statistics
GET	<code>/users</code>	Get list of all users
GET	<code>/tools</code>	Get list of all tools/skills
PUT	<code>/block-user</code>	Block or unblock a user
DELETE	<code>/delete-user</code>	Delete a user
GET	<code>/bookings</code>	Get all system bookings

7. Chat APIs (5) - `/api/chat`

Method	Endpoint	Description
POST	<code>/</code>	Access or create a chat with a user
GET	<code>/</code>	Fetch all chats for the user
POST	<code>/message</code>	Send a new message
GET	<code>/:id</code>	Get all messages for a specific chat
DELETE	<code>/:id</code>	Delete a chat

8. Payment APIs (4) - `/api`

Method	Endpoint	Description
POST	<code>/payment</code>	Create a new Razorpay payment
GET	<code>/payment-history</code>	Get user payment history
POST	<code>/verify</code>	Verify payment status with webhook
GET	<code>/get-key</code>	Get Razorpay client key

9. Review APIs (4) - `/api/review`

Method	Endpoint	Description
POST	<code>/</code>	Add a new review
GET	<code>/:toolId</code>	Get all reviews for a specific tool/skill
PUT	<code>/:id</code>	Update an existing review
DELETE	<code>/:id</code>	Delete a review

10. Report APIs (3) - `/api`

Method	Endpoint	Description
POST	<code>/report</code>	Create a new report (issue with tool/user)
GET	<code>/reports</code>	Get all reports (Admin)
PUT	<code>/report/resolve</code>	Mark a report as resolved

11. Notification APIs (2) - `/api/notifications`

Method	Endpoint	Description
GET	<code>/</code>	Get all notifications for user
PUT	<code>/read</code>	Mark notifications as read

12. Trust Score APIs (2) - `/api`

Method	Endpoint	Description
GET	<code>/trust-score</code>	Get the trust score for the current user
GET	<code>/rating</code>	Get the rating details

13. Wishlist APIs (1) - `/api/wishlist`

Method	Endpoint	Description
POST	<code>/</code>	Toggle a tool/skill in the user's wishlist

14. System APIs (1) - `/api`

Method	Endpoint	Description
GET	<code>/health</code>	Health check endpoint for monitoring

Tech Stack

Frontend

React 19 & React Router v7

Vite (Next-generation frontend tooling)

Tailwind CSS v4 (Utility-first styling)

Lucide React & React Icons

Socket.io-client (Real-time updates)

Axios (API requests)

Backend

Node.js & Express 5

MongoDB & Mongoose

JSON Web Tokens (JWT) & Bcrypt (Authentication)

Socket.io (WebSockets)

Razorpay (Payment Gateway Integration)

Nodemailer (Email notifications)

Getting Started & Running Locally

To get the project running seamlessly on your local machine:

Clone the repository:

```
git clone https://github.com/sakshamshakya337/Neighbor-hood-SkillTool-Sharing-Exchange.git
```

```
cd Neighbor-hood-SkillTool-Sharing-Exchange
```

Install Dependencies: Make sure to install dependencies from the root directory.

npm install

Environment Variables: Create a .env file in the root directory and configure the required variables:

```
PORT=5000
```

```
MONGO_URI=your_mongodb_connection_string
```

```
JWT_SECRET=your_jwt_secret
```

```
CLIENT_URL=http://localhost:5173
```

```
RAZORPAY_KEY_ID=your_razorpay_key_id
```

```
RAZORPAY_KEY_SECRET=your_razorpay_key_secret
```

```
# Other email/SMTP configurations...
```

Run the Application: Use the dev script to concurrently start both the backend Node.js server and the Vite React frontend.

`npm run dev`

Frontend will run on <http://localhost:5173> and backend on <http://localhost:5000>.

Real-Time Use Cases

1. The "Escrow-Protected" High-Value Tool Rental

The Real-World Scenario: John owns a \$500 professional power drill. His neighbor, Sarah, needs it for a weekend DIY project. John wants to help but is afraid Sarah might break it or accidentally keep it.

Why Our App is Better: On Facebook Marketplace or Craigslist, lending high-value items to strangers is incredibly risky because there is no safety net.

The Advantage: Our application integrates Razorpay to handle upfront Security Deposits. Before Sarah can book the drill, she must pay a fully automated, secure deposit. If she damages or fails to return the tool, the platform's admin panel allows John to claim the deposit. This built-in financial security creates a high-trust environment where people are actually willing to share expensive items.

2. The "Unified Ecosystem" (Products + Services)

The Real-World Scenario: An elderly resident needs their lawn mowed. They don't just need a lawnmower; they need the physical labor (the skill) to do it.

Why Our App is Better: Existing platforms isolate these needs. You go to Fat Llama to rent items, and Upwork/TaskRabbit to hire skills.

The Advantage: Our platform operates a Dual Marketplace. A user can rent out their physical lawnmower (Tool) to one neighbor, and simultaneously offer their weekend time for gardening (Skill) to another. It centralizes all neighborhood needs into a single, cohesive ecosystem.

3. Hyper-Local, Verified Trust vs. Global Anonymity

The Real-World Scenario: A mother is looking for a math tutor for her high-school son. She wants someone safe, local, and trustworthy—ideally someone from the same community.

Why Our App is Better: Global freelance platforms (like Fiverr) connect you with anonymous people across the globe, and classifieds are often filled with scams or unverified profiles.

The Advantage: Our application requires Neighborhood Verification and utilizes a proprietary Trust Score and Review System. You aren't hiring a random stranger; you are hiring someone with a high Trust Score who lives in your verified local radius and has been reviewed by other neighbors you might actually know.

4. Privacy-First Coordination

The Real-World Scenario: Two neighbors agree to share a projector for a movie night. They need to coordinate the pickup time and address.

Why Our App is Better: Usually, people have to exchange personal phone numbers or WhatsApp details, which breaches personal privacy and can lead to unwanted future contact.

The Advantage: Built-in Real-Time Chat (via Socket.io). All coordination, logistical planning, and address sharing happen securely inside the app. Once the rental is complete, users don't have to worry about their private phone numbers being exposed.

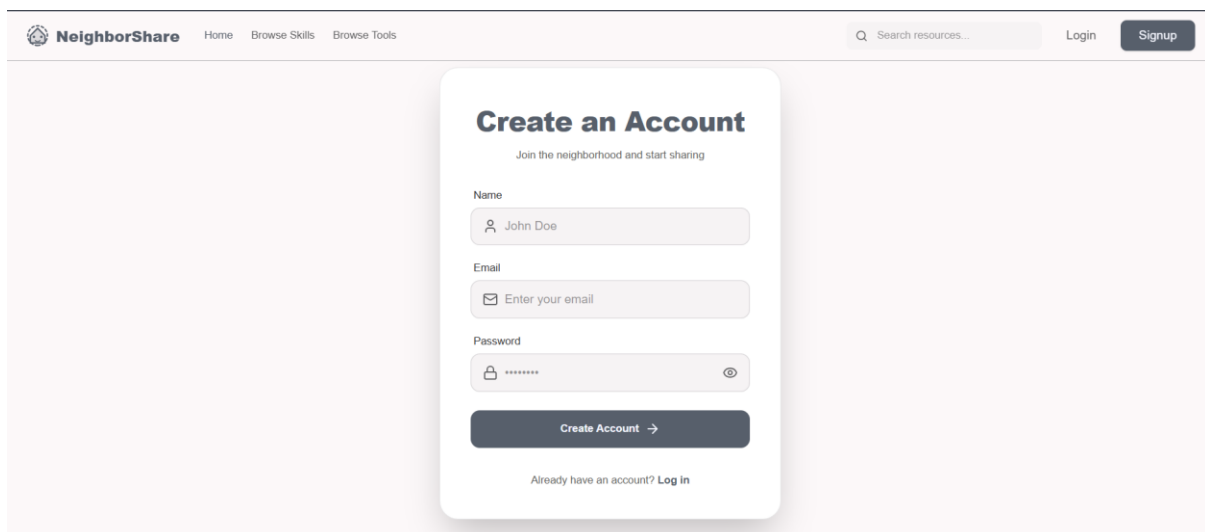

5. Automated Lifecycle Management

The Real-World Scenario: A user rents out their DSLR camera. The borrower is 3 days late returning it.

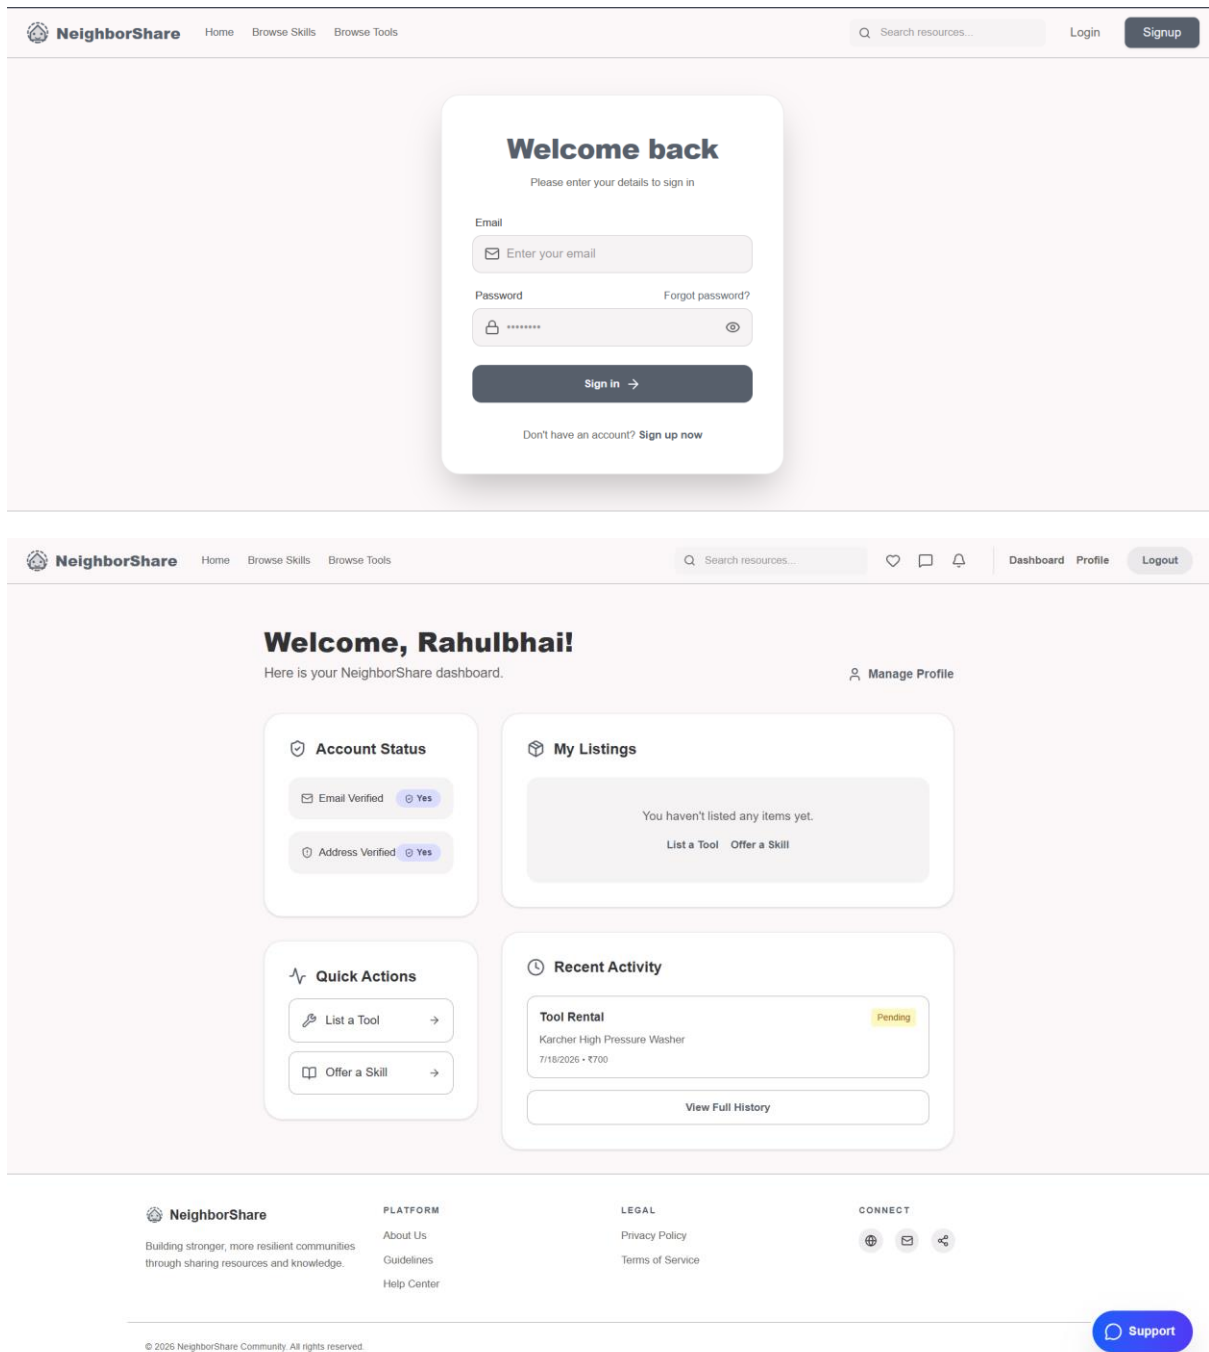

Why Our App is Better: On generic platforms, once the initial transaction is done, the platform washes its hands of the deal. If someone is late, the owner has to awkwardly confront them.

The Advantage: Our app manages the End-to-End Booking Lifecycle. It automatically tracks booking dates, prevents double-booking through availability checks, sends automated reminder emails via Nodemailer, and includes an API specifically for enforcing and paying Late Fees (/booking/:id/pay-late-fee). The system does the awkward collection work for you.

Implementation Results

The screenshot shows the 'Create an Account' form on the NeighborShare website. The form is centered on a light pink background. At the top, the NeighborShare logo and navigation links (Home, Browse Skills, Browse Tools) are visible on the left, and a search bar, Login link, and Signup button are on the right. The form itself has a title 'Create an Account' and a subtitle 'Join the neighborhood and start sharing'. It contains three input fields: 'Name' with a user icon and the text 'John Doe', 'Email' with an envelope icon and the placeholder 'Enter your email', and 'Password' with a lock icon and masked characters. Below these fields is a dark blue 'Create Account' button with a right arrow. At the bottom of the form, there is a link that says 'Already have an account? Log in'.

Conclude

The Neighborhood Skill & Tool Sharing Exchange is a secure, hyper-local peer-to-peer platform built on the MERN stack to foster community resource sharing. It operates as a unique dual marketplace where verified neighbors can seamlessly rent out physical tools or offer professional and casual skills to one another. To eliminate the financial risks of lending to strangers, the platform integrates Razorpay for automated upfront security deposits, rental payments, and late fees. It features an end-to-end booking lifecycle manager that tracks availability, approvals, and reminders automatically, removing the hassle of manual coordination. Users can coordinate logistics and pickup times entirely privately using real-time in-app chat powered by Socket.io, protecting their personal contact details. The entire ecosystem is kept safe, transparent, and accountable through a robust proprietary trust score system, user reviews, and a dedicated admin moderation dashboard. Ultimately, this platform transforms traditional, high-risk neighborhood borrowing into a formal, reliable, and highly sustainable localized micro-economy.
